The Archive is the Java CAPS 5.1 project export archive and includes the Java CAPS Environment. I imported the project contained in the archive into Java CAPS 7 Update 1 just now. All imported without errors or warnings. I did not verify every project or built it to make sure it still works.

To import the archive you will need to have all the components that are used in all the projects installed. I have not checked lately what the specific components are. I have the following components are installed in my Java CAPS 6 Classic.
